

## large valve assessment

### Rehabilitation and Repair

The operability of large valves is essential to controlling the water system. Large valves are also expensive to replace. Consider the related costs: excavation, old valve removal, new valve insertion, service disruption and traffic congestion.

Each valve receives a multi-point inspection and condition assessment. Next it's put through a series of operability tests which result in a detailed condition analysis with recommendations. If needed, the valve is rehabilitated and repaired, then brought back to service with a condition report and full maintenance plan.

We have serviced thousands of valves nationwide, many more than 100 years old.
