

protect water assets

During Road Construction

It is mission critical that utility assets such as valves have accessibility before, during and after road construction. Pave-overs are common, costly and threaten public safety.

Before construction begins, partner with Wachs Water Services to locate and document each water asset. As construction progresses, we will revisit sites to determine if assets are still accessible. Post construction, expect a final report noting the location and accessibility of each asset.

Focus your investment in water assets.
